

1       **ABSTRACT**  
2

3           A system is presented including a plurality of sources, and an interface,  
4 selectively coupled to the plurality of sources, to generate and implement a  
5 development project of processing chains, wherein the interface dynamically loads  
6 a processing chain for each of the plurality of media sources at a point during the  
7 execution of the project when the chain is required, and wherein the interface is  
8 configured to unload at least a subset of the chains when they are not required.
